

Persistent Variables

Variables, or Persistent Variables are made to further unlock configuration potential by allowing users to create custom values that take user-configured values based on signals. This is a more advanced menu and we don't encourage diving in unless you have a specific need and have been directed by support to use these.

Variables are Set to a value via any Signal, either ones already configured, or a new one. Same Variables are then kept (persistantly) until Set again (or reset) but different signal. In the sample below we set a Variable named Test Var to 1 when NQ_3B_Long signal is matched, and then we set it to 2 when Signal EOD is matched.

Persistent Variable - Test Var

—□×

Name

Test Var

	Signal	Set Value
	 NQ_3B_Long	123 1
▶	 EOD	123 2
*		

Delete

Edit

OK

Variables can be used inside of Signals as additional logic bits for entry, exit, or modification of trades.
